Other Site Characteristics

Valle alpina di origine glaciale del versante meridionale del gruppo dell'Ortles-Cevedale, formata da un alternarsi di circhi glaciali che ospitano laghetti alpini e piccole torbiere. La testata della valle é delimitata da una cerchia di cime che raggiungono i 3.000 m. La vegetazione è rappresentata da foreste di conifere (larice e abete rosso), alle quali in alta quota seguono brughiere subalpine e pascoli alpini. Sono presenti habitat di particolare interesse non compresi nell'all.I della direttiva 92/43/CEE, in particolare: Calamagrostio villosae - Abietetum albae, Caricion fuscae e Caricetalia curvulae -

4.2 Quality and importance

Stupendo esempio di vallata alpina in gruppo montuoso metamorfico, con circhi glaciali, laghetti, torbiere e fenomeni crionivali di grandissimo interesse, anche per l'aspetto connesso con la copertura vegetale. Stato di conservazione ottimo. Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi.
