Other Site Characteristics

Altipiano carsico che interessa principalmente la fascia altomontana e subalpina, propaggine nordoccidentale dell'Altipiano di Folgaria. Il paesaggio vegetale è caratterizzato da lembi di abetina con faggio che sfumano in una pecceta e quindi in un lariceto radi; al di sopra si trova una vasta mugheta; solo in alto si osservano lembi di praterie alpine e aree di cresta. La presenza di una malga ancora monticata garantisce la sopravvivenza di almeno una parte delle aree a pascolo presenti nella fascia del peccio. Sono presenti habitat di particolare interesse non compresi nell'all. I della direttiva 92/43/CEE, in particolare: ambiente sottoroccia, % trascurabile.

4.2 Quality and importance

L'area, decisamente poco antropizzata, (notevole difficoltà di accesso) accoglie un certo numero di rarità floristiche di rilievo. Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi.
