### Other Site Characteristics

Il sito interessa la parte più elevata del caratteristico rilievo calcareo che si trova al centro del vasto fondovalle tra Arco e il Lago di Garda. Esso è caratterizzato da boscaglia di leccio, lembi di prati aridi (in parte anche in ambiente rupestre), una parte dell'olivaia che copre il lato occidentale della collina. Habitat 6210 prioritario (stupenda fioritura di orchidee).

### 4.2 Quality and importance

La presenza di un clima submediterraneo favorisce lo sviluppo di vegetazione assai particolare a livello alpino, della quale la lecceta e l'olivaia sono gli aspetti più appariscenti. Vanno inoltre ricordate alcune rarità floristiche di rilievo. Il sito è inoltre di rilevante importanza per la nidificazione, la sosta e/o lo svernamento di specie di uccelli protette o in forte regresso, e/o a distribuzione localizzata sulle Alpi. Sono presenti invertebrati compresi nell'allegato II e legati a boschi in buone condizioni di naturalità.
