4. SITE DESCRIPTION

4.1 General site character

[Back to top](#)

Habitat class	% Cover
N22	100.0
Total Habitat Cover	100

Other Site Characteristics

E' una tra le più interessanti della regione per la presenza di colate di latte di monte biogenico e per la complessa circolazione d'aria nelle diverse gallerie. Contiene concrezioni antichissime (oltre 1 milione di anni) e spesse colate concrezionali fossili. Anche l'habitat è complesso: offre riparo a numerose specie di uccelli, aracnidi, etc.

4.2 Quality and importance

La grotta si apre a m 1880 slm, in una formazione di calcari grigi. E' un complesso ramificato, con sette ingressi posti ad altezze diverse, che provocano una circolazione d'aria particolare, con abbassamento dell'umidità e delle temperature. La circolazione idrica attuale è molto esigua. Le concrezioni attive sono rare.
