Other Site Characteristics

Vasta area montana delle Alpi centrali solcata, nella Provincia di Trento, da tre valli alpine di origine glaciale del versante meridionale del gruppo dell'Ortles-Cevedale. La testata delle valli é delimitata da una cerchia di cime che raggiungono i 3.000 m e gli ambienti sono caratterizzati da un alternarsi di circhi glaciali che ospitano laghetti alpini e piccole torbiere. Sono presenti vasti ghiacciai e imponenti depositi morenici. La vegetazione è rappresentata da foreste di conifere larice cembro e abete rosso, interrotte da vaste radure pascolive di origine secondaria, alle quali in alta quota seguono brughiere subalpine e pascoli alpini. Sono presenti habitat di particolare interesse compresi nell'all.I della direttiva 92/43/CEE, in particolare: Calamagrosti villosae - Abietetum albae, Caricion fuscae

4.2 Quality and importance

Stupendi esempi di vallate alpine in gruppo montuoso metamorfico, con circhi glaciali e imponenti apparati morenici laghetti, torbiere e fenomeni crionivali di straordinario interesse, oltre che per l'aspetto paesaggistico, anche per l'osservazione del dinamismo della vegetazione pioniera. Stato di conservazione ottimo degli ecosistemi di alta quota, che sono praticamente intatti. Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi.
